

Sorting

Kate Gregory

@gregcons www.gregcons.com/kateblog

Sorting

`sort(it1, it2)`

Overload operator `<`

`sort(it1, it2, lambda)`

Stable Sort

Sort, then sort
again by another
property

Should “ties” on
the second sort be
in their original
order?

You decide

Is It Sorted?

`is_sorted(it1, it2)`

`is_sorted(it1, it2, lambda)`

Find the Largest, or Smallest, or ...

Unsorted collection

Checks every element

`max_element()`

`min_element()`

`find()`

Sorted collection

Largest is last, smallest is first

Can do a binary search for any value

`upper_bound()`

`lower_bound()`

Shuffle

```
#include <random>

// . . .

random_device randomdevice;

mt19937 generator(
    randomdevice());

shuffle(it1, it2, generator)
```

- ◀ Bring in another header
- ◀ Once your collection is in place
- ◀ Create a random device
- ◀ Create a Mersenne Twister to use as a generator
- ◀ Pass the generator to shuffle

Partial Sorting

`partial_sort()`

`is_sorted_until`

`partial_sort_copy()`

1

5

4

2

9

7

1

2

4

9

5

7

Nth Element

1	5	4	2	9	7	3	8	2
---	---	---	---	---	---	---	---	---

1	5	4	2	9	7	3	8	2
---	---	---	---	---	---	---	---	---

1	2	3	2	4	7	9	8	5
---	---	---	---	---	---	---	---	---

What are you trying to do?

Summary

Sorting is trivial for elements with `<`

Provide a lambda for complete control

When sorting multiple times, consider `stable_sort`

Want to know if it's sorted? `is_sorted()`

In a sorted collection, faster searches are available

You can easily shuffle (unsort) as well

You can also do partial sorts and rough groupings if that's all you need
